

MAIN CONTEST QUESTION

THE CLIENT PACK

Everything below is what the client actually sent. It is incomplete, out of order, and in places contradicts itself. Extracting the real requirements is the first phase of your work.

ITEM 01 EMAIL, FORWARDED

From Anisur Rahman <anisur.ops@greentex-apparel.com>
Subject URGENT: Commuter app for factory staff
Sent 09:15 AM

Dear team, hope you are well. As discussed over phone we want to build an app for our factory workers. We have around 15,000 workers across 4 garments factories in Gazipur. Transport is a huge mess. Workers stand in the rain for hours waiting for our staff buses, they get late, production stops. This is the main thing.

We want an app exactly like Uber. Very premium, smooth animations. The worker opens it and sees their assigned bus moving on a live map so they know exactly when to leave home.

Also, we are heavily subsidising the transport, so they need to pay a daily 10 Tk fee to board. No cash allowed anymore. They must scan a complex QR code pasted on the bus door using the app to pay from their balance.

Most of our workers use cheap Android sets. Data is expensive, but they can just use the factory Wi-Fi to load the app (though they will be at the bus stop 3km away, so maybe figure that out). Many cannot read properly, mostly female workers. Keep English as the default language though, because we have to present this to foreign buyers next month to show our worker welfare initiatives.

For safety, we need a big red SOS button. Since they travel at dawn, if they feel unsafe, they should press it and it will send an automatic email to the local police station. You decide the placement.

One more thing, later we will need a dashboard for the transport managers to assign drivers, and maybe a feature inside the app where workers can buy discounted groceries while riding the bus. Not now. But design keeping in mind.

ITEM 02 NOTES FROM THE KICK-OFF CALL, TAKEN BY A JUNIOR

- 15,000 workers, 40 buses, 8 routes total
- "Map view is an absolute must" - Anisur
- Shift starts at 8 AM. Boarding happens at 6:30 AM in the dark.
- phones mostly have broken screens, dim brightness
- QR code payment? half the workers have scratched phone cameras
- rain and sweat makes touchscreens hard to use during monsoon
- factory Wi-Fi doesn't reach the bus stops. offline mode needed?

ITEM 03 VOICE NOTE FROM THE FIELD OFFICER, TRANSCRIBED

"Sir, regarding the app—the girls on the floor do not understand live maps. They just want a notification or a big text that says 'Bus is 10 minutes away' or 'Bus is full, take the next one'. Also, scanning QR codes at 6:30 AM in a pushing crowd won't work. Can they just use a 4-digit PIN to confirm they are on board? Oh, and the SOS button... emailing the police is useless, they never check it. It needs to instantly alert our factory security gate with the specific bus number."

MONIRA KHATUN | HR SUPERVISOR | 3:42 VOICE NOTE

ITEM 04
SMS

"forgot to say, app should be called 'GreenCommute'. and can it track if the driver is speeding? thanks"

What we need from you

Six phases in one six-hour sitting. Each deliverable must be in the file, labelled, before the next phase opens.

TOTAL MARKS

100

- | | | |
|---|---|----|
| 1 | Requirements & discovery
The brief rewritten as requirements - functional and non-functional, separated. Contradictions named and resolved, with your reasoning. | 15 |
| 2 | Research & validation
Personas for the worker and one secondary user (e.g., driver or security guard). A journey map for a rainy morning commute when the bus is delayed. Unverified assumptions stated as assumptions. | 15 |
| 3 | Information architecture & low-fi
Sitemap, one core user flow (boarding and payment), and wireframes for every screen you commit to plus one home-screen alternative you rejected. | 15 |
| 4 | High-fidelity UI
Finished screens including the waiting state, the active in-transit state, and the panic/SOS state. High contrast for dim screens, designed for one-handed use in crowds. | 25 |
| 5 | Figma ecosystem
Named variables, components with variants, auto layout, and a clickable prototype of the primary boarding flow and triggering the SOS. | 15 |
| 6 | Handoff
Redlines for the home screen and a one-page note a developer could build from without asking you a question. | 15 |

SUBMISSION

A Google Form will be provided via email.

WHAT TO SUBMIT

A single PDF containing all phase contents.
